Dejel Cyrus De Asis

BS Computer Science - University of the Philippines Visayas

Technology and Mathematics Portfolio

About Me

Interests: Quantum computing, cybersecurity, applied mathematics, computer vision, privacy-preserving systems, emergency-response software, and full-stack product engineering.

Mission: I build software that turns technical ideas into practical systems for safety, learning, public service, and operational decision-making.

Key Skills: Python, TypeScript, JavaScript, React, Expo, FastAPI, Supabase, PostgreSQL, C/C++, Java, Solidity, Linux, Git, cloud deployment, API integration, and cybersecurity tooling.

Current Focus: BS Computer Science coursework, CTF practice, real-time monitoring systems, AI-assisted workflows, and portfolio-ready project documentation.

Major Achievements

Champion - Quantum Computing & Cybersecurity CTF

Jan 2026

- Won Champion in the Philippines' quantum-themed cybersecurity CTF competition.
- Solved challenges involving quantum computing concepts, cryptography, circuit reasoning, cybersecurity, and problem-solving under time pressure.
- Portfolio evidence: include an award photo, certificate, challenge summary, and short reflection on how quantum concepts connected with cybersecurity practice.

Champion - TrackTech Hackathon 2026

Jan 2026

- Won champion in CPU TrackTech Hackathon with the theme about track technology.
- Applied Computer Vision along with mobile-to-cloud computing optimizations.
- Applied lightweight telemetry for a smooth user experience.

1st Runner-Up - Hack4Gov

Jan 2025

- Earned 1st runner-up and top-performing participant recognition in the Hack4Gov 2025 cybersecurity competition.
- Competed in network analysis, digital forensics, cryptography, web exploitation, and Linux-based investigation workflows.
- Portfolio evidence: include event photos, certificate or award proof, challenge categories, key tools used, and a reflection on public-sector cybersecurity readiness.

DOST Scholar

- Recognized as a DOST scholar while pursuing BS Computer Science.
- Connects academic work in science, technology, engineering, and mathematics with applied software projects and public-interest technology.
- Portfolio evidence: include scholarship proof or certificate and a short note on how the scholarship supports continued technology and mathematics work.

Projects

Manobela

- Problem: Driver fatigue and distraction can be difficult to detect early, especially without expensive in-vehicle hardware.
- Solution: Built a real-time driver monitoring system using mobile camera input, facial landmark telemetry, and cloud-assisted processing.
- Architecture and screenshots: [project site](#), [project article](#), [monitor screenshot](#), [insights screenshot](#), and [session details screenshot](#).
- Impact: Demonstrates how computer vision, mobile development, and cloud services can support safer driving workflows for commuters, delivery drivers, and long-haul drivers.

Project HERMES

- Problem: Emergency reports often arrive as unstructured messages, making it harder for responders to classify incidents, monitor status, and coordinate action.
- Solution: Built a Hazard and Emergency Reporting, Monitoring, and Evaluation System for real-time disaster communication workflows.
- System screenshots and concept: [project article](#), live dashboard concept, report intake flow, role-based access control, and Supabase-backed incident monitoring.
- Impact: Shows how emergency-reporting software can convert citizen or chat-based reports into structured operational information for responders and coordinators.

PrivMotion

- Problem: Motion-analysis workflows often depend on identity-bearing images or video, creating privacy and retention concerns for research and health-oriented settings.
- Solution: Built a privacy-preserving motion analytics prototype that converts visual input into skeleton keypoints, silhouettes, depth-like surrogates, and kinematic features.
- Privacy and architecture evidence: [project article](#), [GitHub repository](#), anonymized output pipeline, metadata records, optional feature encryption, and audit-oriented design notes.
- HIPAA-oriented design: Supports aggregate/de-identification-oriented workflows for qualified review, while clearly separating prototype behavior from formal HIPAA certification.
- Use cases: Research motion analysis, privacy-aware video preprocessing, kinematic feature extraction, and safer sharing of derived movement data.

Community

NSTP Web Dev 101

- Community teaching activity focused on introducing web development fundamentals through beginner-friendly examples and hands-on outputs.
- Portfolio evidence: include teaching photos, participant work, sample outputs, slides, lesson materials, or before-and-after project screenshots.
- Reflection: Highlights the value of making technical skills accessible to students and community learners.

BERDE

- Spearheaded a community-driven project for a sustainable garden for malnourished children.
- Project grant of PHP 50,000, granted by 3-Zero Club
- An ongoing project still being built at Negros Occidental, Cadiz City

Y4B

- Community project for a Ramsar site development.
- Project grant of PHP 100,000
- An ongoing project still being conducted in Negros Occidental, Cadiz City.

Certificates

NAISC Certificate

- Completed training related to AI, LLMs, and AWS-based implementation.

Singapore (Online)
Jan 2025

Introduction to Cloud 101

- Completed foundational training in AWS Cloud infrastructure, cloud services, and cloud computing concepts.

Introduction to AWS Security

- Completed foundational training in AWS cloud security, including IAM and SIEM concepts.

ISC2 Candidate

- Pursuing a cybersecurity Certificate to a COMPTIA Security+ transition certification.

Software Architecture & System Design Foundations

- Completed training in software architecture and system design foundations.
